- ENDNGS

- Not as emphasised as ending are in mental health

- But depends on the illness and the length of the intervention

- Need to be held in mind as endings are important even if under-emphasised

Evaluation

- Often depends on assessment
- Assessment methods used and whether they are repeatable must be considered
- Patient feedback
- Questionnaires

Challenges

- Only person (CP) dealing with psychological well-being – a lot of pressure
- Increased emphasis on cost and effectiveness
- Limited understanding of CP’s role in physical health settings
- High expectations of CP
- Stigma among patients about seeing a psychologist → see it as a last resort.
