Eastern Mediterranean Health Journal, Vol. 10, No. 6, 2004

sists of cereals, legumes, fruits, milk, honey and fish. In addition, the dietary patterns presented in the Platonic dialogues were very similar to the current Mediterranean diet [3]. Plato suggested that the therapeutic approach to human diseases should be made through the regulation of diet rather than with medication, “Wherefore one ought to control all such diseases, so far as one has time to spare, by means of dieting rather than to irritate a fractious evil by drugging” (Timaeus verse 89C-D). He recognized the importance of the proper nutrition for corporal development in many passages in his texts “for there ought to be no other secondary task to hinder the work of supplying the body with its proper exercise and nourishment” (Laws verse 807D) [3].

In the following centuries, many physicians highlighted the importance of diet in maintaining health and in the treatment of diseases. Members of the famous medical school of Alexandria like Erasistratus and Herophilus (3rd century BC), Celsus (1st century AD) and Galen (2nd century AD), produced many writings on diet [4]. Galen was the Roman emperor’s physician, anatomist, physiologist and a fruitful writer and his word in medicine and science became law for the following 12 centuries. He was one of the believers in diet, and said “health depends chiefly on the choice of food.” He stressed the therapeutic value of climate and a full diet for tuberculosis, and emphasized the value of milk in the treatment of disease [3]. In later years, Boorde, a physician and experienced traveller of the 16th century, wrote 2 short books related to health, Breuvarie of helth and A compendious regimen or a dietary of helth. He included brief chapters on bread, potage (soup), meat, eggs and cheese, fish and fowl, roots, herbs, fruits and spices, and diets for the following: sanguine, phlegmatic, choleric and melancholic temperaments and pestilence, fever, gout, leprosy, consumption, palsy, madness and dropsy.

Hospital dietetics appeared in the 12th century as shown in the records of the history of St. Bartholomew’s Hospital in London, the oldest British hospital, established in 1123 [5]. In the Middle Ages, and even through the 18th century, hospital diet was based on bread. Other components were beef, beef broth, ale cawdel, beer, mutton, mutton broth, cheese, butter, milk pottage, rice milk, sugar soppes and water gruel [1].

Only little change in the type or amount of the daily food allowance for patients at St. Bartholomew’s was noticed a century later [6]. Four different kinds of diet existed at that time; the common diet, the broth diet, the thin or fever diet, and the milk diet. The common diet was simply the main diet. The broth diet was similar to the common diet but did not include meat. The thin or fever diet did not include meat, beer or butter and consisted of 1 pint of milk with tapioca, arrowroot, sago or rice as prescribed, and barley water. The milk diet consisted of milk porridge, 12 ounces of bread, 2 pints of milk with tapioca, arrowroot, sago or rice as prescribed, barley water, 1 ounce of butter and bread pudding 3 times a week when ordered. At that time, most of the other hospitals in London used the same terms to describe their diets, with some including such terms as full, middle, and low diet, and spoon or fever diet [1].

By the early part of the 20th century, therapeutic diets had become more common and were usually named after the physician who prescribed them, such as Meulengracht’s diet and the Sippy diet and the various adjustments of each. Nowadays, emphasis in diet therapy is placed on a diet adequate in all nutrients, with minimal modifications in quantity, consistency and texture of food according to patient needs [1].
by even stronger challenges. As the world changes rapidly, the way dietetics professionals deliver services must change to keep pace. Under this pressure, dietitians have the opportunity to transform their field into a cutting edge profession that addresses emerging and evolving needs of their societies. However, there is nothing that automatically gives this opportunity to dietitians. They will have to shape their destiny and this can only be achieved by a proper and strategic planning and preparation. And as the Japanese proverb says, “Vision without action is a dream; action without vision is a nightmare.” Thus, to be a proper action, any action must be based on a proper vision and strategic planning.
