In the obedient participants, 

- higher levels of autonomic nervous system activity were observed compared to the control group.

- The control group showed little variation in their autonomic nervous system activity.

**Findings:**

- Obedient participants showed a higher degree of autonomic nervous system activity compared to the control group.

- The control group showed little variation in their autonomic nervous system activity.

**Conclusions:**

- The study suggests that obedience can induce a higher degree of autonomic nervous system activity.

- The control group showed little variation in their autonomic nervous system activity.

**Implications:**

- The results have implications for understanding the role of obedience in influencing physiological responses.

- Further research is needed to explore the mechanisms underlying these physiological responses.

**References:**

**Acknowledgments:**

- The authors would like to thank the participants who volunteered for the study.

**Ethical Considerations:**

- The study was conducted with the approval of the ethical review board.

- Participants were fully informed about the nature of the study and provided consent.
