

cracking engineering

1. be attentive during lectures for that there is a simple tip just try to write some lines from each slide and complete the rest in your self study time. writing will help you not getting sleepy or will also help in avoiding distractions

2. take long detailed notes on weekends or whenever you get time during the week. I will suggest to make notes during the week and try to learn and understand them during the weekend.

3. try to do assignment by your own, if you got the deadline of one week from now then start working on your assignment from the day one .. research on different topics, try to think more and more, read between the lines, if gets some time then save few vedios in your phone and watch them in bus or during your leisure time .

4. I know it's hard to make time in four years of engineering, but trust me there are my friends who kept on saying this again and again that there is shortage of time we can not even prepare for graded quizzes but here I am and some of my degree mates who read books publish stories and still get time to read course books and research and still maintain a good CGPA . so make your own time table arrange everything.....think ..

5. now the most important point making time table yes I know you people might think that making timetable when you are in your college or university is a little bit childish thing, yes it is but that's the most important hobby from my childhood which I love to carry till my grave ☺, importance for arranging your duties and responsibilities before time i.e. making timetable will be clear once you start making your timetable and start planning your day in advance..

6. past papers are a must must thing, if you don't have past papers in your college then use Google and start searching for past papers from other colleges here you can 100 Percent get past papers

7. pray . I personally believe in praying more than working hard. . so pray for your self, ask for guidance.

8. never leave anything, if you hate a topic and thinking of probably leaving it then here my friends is the time to love your books from head to toe because in engineering exams you can expect anything form anywhere .. I have a simple tip here, for the topics which you hate start to make smart notes some key points or even a short story...

9. during your labs focus more on practical work then theoretical. as jabeer bin khayain said knowledge without practical work is useless..

10. start learning skills from first semester . it's very very important.

11. make good friends who help you in growing, up skilling

12. eat healthy, start exercise or be lazy like me ☺. but yes watch good science fiction movies and documentaries.
