Introduction to Biology

Biology is the study of living organisms and their interactions with their environment. Living organisms are characterized by the presence of certain characteristics, including the ability to grow and reproduce, the ability to obtain and use energy, and the ability to respond to their environment.

The scientific method is used to study living organisms. This involves making observations, forming hypotheses, testing those hypotheses through experiments, and drawing conclusions. The scientific method is an iterative process, and the results of experiments are used to refine and improve our understanding of living organisms.
