

Output devices an output device is any hardware computer component that gives information to the users

Three commonly used output devices are as follow

A monitor : this output device displays your information on screen

A speaker sound is the type of output you will get from a speaker

Cd and dvd these type of storage media hold much more information than a floppy disk they are also considered portable storage of these types of storage media come in different forms . These means they are cd s and dvds that you can only save information in addition there are those that can both save information on and erase the information you have saved.

Flash drive: this is storage medium that is very easy to carry around and it also holds more data than a floppy disk

Asyou can see from the picture below it is very small compared with the others

Hard drives
