

20th November 2014.

Species.

L.O To understand the ^{difficulties} ~~difficult~~ with defining Species.

What does Species mean?

A Species ~~is~~ is a group of the same organism that can interbreed together to produce fertile [✓] offspring. Good.

Problems with Species definition.

- 1) ~~Hybrid~~ Hybrid: 2 different species [✓] interbreeding.
- 2) Most hybrids are infertile - can't have offspring
- 3) Bacteria is a protist that reproduce asexually (one [✓] parent).

It is too simple because there are more to it like the problems it has 3 problems and a next thing is you can make a hybrid so that is 2 different animals.

Hybridisation - Breeding between 2 different species

^{ducks} Mallards can make hybrids and ~~then~~ ^{then} hybrids ~~can~~ ^{can} reproduce. True!!
