

Global electricity production in 2011

*

The pie chart shows that the amount of oil used for electricity production is low, considering it is a fossil fuel and in comparison to the other two (coal and natural gas). However, this graph only shows the statistics for global *electricity* production. If one was to look at the global energy production in 2011, it would show a much more representative image (Figure 2) [1]

Global energy production in 2011
