

Multiple intelligences

It was a book written by Howard Gardner, in which he explains that there are several types of intelligences associated with different capacities

Year 1900: intelligence test - IQ

This test was created to see the real or potential intelligence creating a one-dimensional vision of the evaluation of the minds of the people. This allowed to determine the probability of school success but not of life.

The theory of multiple intelligences raises intelligence as the ability to solve problems or develop products in a context, and proposes 7 different types

Linguistic intelligence: typical of poets. Universal languages, their development in children similar in every culture.

Logical-mathematical intelligence: it has to do with the scientific and is characterized by the rapid solution of problems where many variables are handled and hypotheses are created.

Space intelligence: ability to form a mental model of a three-dimensional world. Developed for engineers, sculptors, painters and painters

Musical intelligence: related to sounds is a universal faculty

Body intelligence and kinesthetic: is the ability to solve problems using the body. Characteristics of dancers, athletes and craftsmen.

Interpersonal intelligence: feel contrasts in others. Like your moods, emotions and intentions. In some cases you can read intentions and wishes. Appears in political leaders, teachers, therapists and good sellers.

Intrapersonal intelligence: knowing aspects of oneself. Understand emotions and feelings in order to distinguish them, to distinguish and name them and use them to interpret and guide their own behavior.

All intelligences work together to solve problems and achieve goals. You cannot have any special intelligence and fulfill a function in a unique way by combination of skills. The schools should develop the intelligences and help reach vocational ends; those who support this support feel more competent and willing to serve society.
