we see that maximin lies on
lin ③ and ④. Thus we equate
3 and 4 line

$$4 - 7x_1 = -6 + 13x_1$$

$$13x_1 + 7x_1 = 4 + 6$$

$$x_1 = \frac{1}{2}$$

Thus the maximin occurs at $x_1 = \frac{1}{2}$
So the optimal strategies for
player A are $(\frac{1}{2}, \frac{1}{2})$
