

Kinematics

$$\text{Speed} = \frac{\text{distance}}{\text{time}}$$

shortcuts

$$\begin{array}{ccccc} \text{mm} & \xrightarrow{10} & \text{cm} & \xrightarrow{100} & \text{m} & \xrightarrow{1000} & \text{km} \\ \text{sec} & \xrightarrow{60} & \text{min} & \xrightarrow{60} & \text{h} & & \end{array}$$

$$10 \text{ m/s} \rightarrow \text{km/h}$$

$$\frac{10 \text{ m}}{1 \text{ s}} \div 1000$$
$$\div 3600$$

$$\frac{10}{1} \times \frac{3600}{1000}$$

$$= 36 \text{ km/h}$$

$$30 \text{ km/h} \rightarrow \text{m/s}$$

$$\frac{30 \text{ km}}{1 \text{ h}} \times \frac{1000}{3600}$$

$$30 \times \frac{1000}{3600}$$

$$= 8.33 \text{ m/s}$$

Acceleration: tells us if a body is speeding up or slowing down

$$\text{Initial} = u$$

$$\text{Final} = v$$
