

2 component of fractionated reaction time
EMG recording will indicate the time at which the muscle shows increased activity after the stimulus signal has occurred.

Premotor time

The measure of the receipt and transmission of information from the environment, through nervous system, to the muscle itself. Consider as indicator of perceptual and cognitive decision making activity.

Motor time

Indicate that there is muscle activity before observable movement occurs. Also consider as indicates a time lag in the muscle that it needs in order to overcome the inertia of the limb after the muscle receives the command to contract.
