

separated by commas. Keys are case sensitive and the same name but different case of key will be treated distinctly. Keys can't be repeated and must be immutable so keys are immutable and can not be repeated.

An empty dictionary can be created just by placing the curly braces I have shown you in this example so moving forward let us now see the dictionary how to create a dictionary using inbuilt function. In Python there is an unordered collection of data type that is mutable mutable and has no duplicate elements in it. After this course you will be better prepared to crack data structures and algorithm interviews. A set can not have mutable elements like list or dictionary as it is immutable so let us create a set and have a better understanding on set so to creating a set we just have the similar process as we were seeing in this video that is let's say I have created a set one and using an inbuilt function we can create a set. The thing about set that you need to remember is that a set contains only unique elements but that at the time of set creation multiple duplicate values can also be passed.
