

Ischemia - causes, symptoms, diagnosis, treatment & pathology
Osmosis from Elsevier

Hypoxic conditions can be caused by many different things, including: lowered blood flow due to something blocking the blood from the inside or compressing the blood vessel from the outside (ischemia); Traumatic injury causes ischemia; Buddchiari syndrome is a type of ischemia caused by a blocked hepatic vein; if the oxygen supply is low enough for long enough it can cause cell death (cell death); too much time has passed and the cells have actually died, the ischemic damage is irreversible (infarction); one example of irreversible damage is something like heart attack or myocardial infarction, where an artery supplying a specific part of the heart with blood becomes blocked (heart attack).
