

easy to write programs in machine language because it's not portable in one machine if you write program for edition then again you have to write rewrite that program for second machine. Assembly level languages come assembly level languages and after that languages come to overcome limitations to add portability concept.

C is a system programming language language many softwares have been written in c language oracle android.

During 1980s c was the most widely used programming language and in 1989 it was standardized by ansi that is why it is called a nsic and see how the computer is going to understand what whatever we will write in c.
