

computer science in Python..

At the heart of every computer, there 's just this basic architecture and it contains four main parts. the Alu is where all of the operations are done.. The control unit contains one program counter. when you load a sequence of instructions, the program counter starts at the first sequence. it gets what the instruction is, and it sends it to the Alu. Alan Turing showed that you can compute anything using the six primitives. Alan Turing said that you could compute anything with these six commands. the primitives are move left, move right, read, write, scan and do nothing. using those six instructions., programming
