

- The indohyus developed and were the ancestors of whales, dolphins, sea turtles, and mammals.
- The departure of dinosaurs gave the new species an opportunity to flourish, and that species was of mammals.
- The first whale was named pekicetus who was a land animal who evolved themselves in water slowly slowly other animals evolved slowly.
- Asteroids falling further led to the end of the dinosaur, and the Earth slowly started becoming normal.

The Earth slowly began to become normal again, and the animals evolved and created new species of animals. The Earth started to become more like normal again. After which the Earth began to be normal again, and the animals that evolve again.
