

Within the anchor element (<a>) is the href attribute that specifies the destination for the link. This destination can be a webpage on your own site or it can link to an outside website.

For example:

```
<a href="https://www.example.com">Click here to visit Example.com</a>
```

In the example above, the link leads to an outside website (https://www.example.com).

Note that text that comes before the anchor element (like "Please click on this link") is not actually part of the link.

In the next video, we will explore links further and learn how to link to different sections within a webpage.
