

## Introduction to Web Technologies

Welcome back, students! Today, we will be diving into the subject of web technologies. This is an important subject if you want to develop software products, as it covers the basic concepts needed for software development. In this video, we will be discussing the history of the internet, its basic services, search engines, and the users of the internet. Let's start with the definition of the internet.

### Definition of the Internet

The internet is a network of computers that links many different types of computers all over the world.

### History of the Internet

The history of the internet has its roots in the ARPA (Advanced Research Project Agency) Net system, which was developed by the US Department of Defense. The ARPA Net system was the first wireless network, introduced in 1969. From this system, the internet evolved with the basic idea of interconnecting computers. Initially, research organizations and universities used the internet to share and exchange information. In 1989, the US government lifted restrictions on internet usage, allowing it to be used for commercial purposes. Since then, the internet has grown rapidly to become the world's largest network, connecting more than 30,000 networks, 10 million computers, and over 50 million computer users in more than 150 countries.

I hope this gives you a brief understanding of the history of the internet. Thank you!
