Geography, Transparency and Institutions
With a simple two period version of the model

Putting aside the questions of inequality, poverty traps and economic growth we turn to deep incision factors. Why are some countries so wealthy relative to others? What are the proximate factors which allow some countries to do well? What are the deep factors which underlie these proximate factors?

Geographical factors: tropical climates may make a disease environment. Different regions of the world have different histories of war and violence. Some countries are landlocked and have little access to a port. Arbor makes no trade.

Douglas North: Autocracy, Economic Institutions. The rules of the game (democracy/ dictatorship, etc.)
Emphases on property rights
Rule of Law: the way the state intervenes to protect peoples' property rights.
Political Institutions: the way the state intervenes in economic activity.

The "rules of the game" and "political institutions" are related to the ability to make credible promises which are affected by geography and technology.

- Both theories presumably believe that extracting resources by the state is easier in democracies with free elections, and if the incentive and scope for the provision of public goods.

- We argue that the importance of geographical conditions and technology determine the state's ability to make credible promises.

Differences in geographical conditions - land suitability for different crops has an effect on the tax technology.
Technology: the ability of the state to obtain resources from its citizens.
State capacity: the easier it is to tax, the easier it is to build state capacity.

2. Emergence of the State

2. The emergence of the state
According to the existing literature
Neolithic Revolution
(Settled agriculture and stone subsistence)
→ We infer that did not produce food
(hierarchical societies)
→ The emergence of the state

Pseudo-paper
About the emergence of hierarchy and differences across countries in state capacity.
Then presentation of the model which we have the hand out for.
Finally: application of the model to explanation of differences across Europe.

Existing Literature: recent summaries

Jared Diamond (1997)
Guns, Germs and Steel: animal domestication, food surplus → ability to provide public goods → state capacity

Douglas North and Clifor Barr Weast (2010)
"Cultivation supported a stable population that resulted in the formation of elite groups"
