

```
plt.ylabel('Y')  
  
plt.title('Circle Drawing using Bresenham Algorithm')  
  
plt.gca().set_aspect('equal', adjustable='box')  
  
plt.grid(True)  
  
plt.show()
```

Define the center and radius of the circle

```
x_center, y_center = 0, 0
```

```
radius = 10
```

Get the points for the circle

```
circle_points = draw_circle_bresenham(x_center, y_center, radius)
```

Plot the circle

```
plot_circle(circle_points)
```

output

pip install matplotlib

Q5. Write a program to perform 2D Translation

```
import matplotlib.pyplot as plt
```

```
angle_degrees = 45
```

```
# Get the rotated points
```

```
rotated_points = rotate_2d(original_points, angle_degrees)
```

```
# Plot the original and rotated points
```

```
plot_points(original_points, rotated_points)
```

outputs

```
pip install matplotlib
```

Q7. Write a program to perform 2D Scaling

```
import matplotlib.pyplot as plt
```

```
def scale_2d(points, sx, sy, origin=(0, 0)):
```

```
    origin_x, origin_y = origin
```

```
    scaled_points = []
```

```
    for (x, y) in points:
```

```
        scaled_x = origin_x + sx * (x - origin_x)
```

```
        scaled_y = origin_y + sy * (y - origin_y)
```

```
        scaled_points.append((scaled_x, scaled_y))
```

```
    return scaled_points
```
