

The eye

- 1) The pupil is a hole in the iris which lets light through
- 2) The eye is filled with clear liquid which supports the spherical shape
- 3) The retina is the light sensitive part which is covered in rods and cones which detect light
- 4) Rods are more sensitive in dim light but only see black and white
- 5) Cones are sensitive to colours but are not so good in dim light
- 6) the fovea is packed with cones
