

Network cards

A network card is a circuit board that is placed into computers so that users will be able to have access to the Internet, furthermore without this technology users would not be able to use the Internet. There are different types of network cards as they are designed for specific purposes; some of these network cards have the ability to serve more than one network, which could be very useful for businesses.

Peripheral devices

Output devices (e.g. monitor, printer)

Printers

A printer is an output device that accepts texts and images. There are different kinds of printers. There are laser printers, which produce high quality documents, and they are commonly used in workplaces such as offices, because they are quiet, work efficiently and have a greater speed.

Monitors

A monitor is the screen that shows the images from the computer. It displays the video and graphics information generated by the computer through the video card; they are the same as a television but you can see the information and graphics have a higher resolution.
