

An effect of ICT on the society is that people can use internet to do shopping rather than leaving their home. People who cannot currently leave their houses, the physically disabled or people who are busy to do anything to do shopping, who currently rely on other people to do their shopping, near-free internet shopping could allow people to be more independent and less reliable on other people.

Another effect of ICT on the society is that people start to work at home by internet. By this, the amount of required offices may be reduced; so people don't need to waste their money on building a large office. This would result in fewer buildings in the city centre and reduce traffic pollution from people who are no longer required to come to work. Reducing the traffic pollution means that the amount of CO₂ released into the atmosphere will be reduced which would mean that it won't cause any harm to the world.

Moreover my third reason is that the amount of technology has grown rapidly that you can control your Heating, lighting, and appliances using your Smartphone, meaning that if you forgot to turn your heating off, then you can off it by your phone!

However, there is also some disadvantage of the impact of ICT in the society, because it could reduce your privacy, you are less likely to have low level of security. As more and more information is collected and stored on the internet, hackers use camera's and secretly located spy to blackmail someone. It could make a big issue out of it. Company or trade secrets could be released on to the internet. It is very important to keep things private as crime rate is increasing.

Another huge negative impact of ICT in the worldwide is that children start to use social media very young. And some children talk to strangers and share their very personal details to them. After sometime, the strangers takes advantage of this and start to slowly blackmail the child. This is very dangerous for kids as some children suicide themselves out of depressions.

Another important issue is the currently less computer related jobs. For instance, manual jobs. These jobs have been reduced by computer and technology. Meaning that very computer skilled people cannot get a job in the internet. Instead, they have been replaced by computer –controlled machinery such as robot.
