

Conclusion

Outsourcing also has its disadvantages. The main one is trusting a third-party provider for all of your company's IT needs can create serious security issues. IT outsourcing is not a panacea and should never be confused as one. If your business is having trouble managing technology on its own, it's likely that an IT outsourcing provider will be bound by the same constraints that make in-house management difficult, research further on the difficulties you are facing to understand whether you there is a real need to outsource. Things like poor system construction, inefficient communication, and lack of scalability are not problems that an outsourcing company will be able to fix overnight, irrespective of how great they are at doing their work.

It's a good idea to ask yourself why you're considering outsourcing. If it's to take advantage of the specific benefits mentioned above, you're probably a good candidate. If it's because you're unable to manage problem systems or processes on your own, you may need to address these issues first before involving a third party.

The most important fact is that Mr/Ms. CIO you are responsible for making that decision, please make sure that you are making the right choice.
